## Summary

Engineer from India, living and working in Japan. B.Tech in Computer Science (Amity University, 2024). Since 2025 I have been automating CAD design work (AutoCAD, AP100) with Python and VBA at a Japanese manufacturing company, working every day in a Japanese-speaking team. I build fast with AI (LLM tools such as Claude Code) and want to join a Tokyo team building AI-powered SaaS products. Work visa held — no sponsorship needed.

**Target roles:** AI product / AI SaaS development · AI & automation engineer · cloud-based development — Tokyo (or another major city)

## Experience

| Design Automation Engineer — manufacturing company, Japan                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 2025 – present |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|
| <ul style="list-style-type: none"><li>• Build Python and VBA tools that automate CAD design work in AutoCAD and AP100</li><li>• Remove repetitive work: batch-processing drawing data, cleaning up bills of materials (BOM), organising drawing files</li><li>• Support design work on projects for industrial clients</li><li>• Work day to day in Japanese — reporting, consulting and coordinating with the team (報連相)</li><li>• Use LLM tools (e.g. Claude Code) to prototype and ship tools faster</li></ul> <p><b>Tech:</b> Python, VBA (Excel), AutoCAD, AP100, Git</p> |                |

## Projects

|                                               |                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CAD automation toolkit                        | Python batch processor that reads DXF drawings into a CSV of drawing numbers and revisions, a VBA BOM clean-up macro, and a drawing-file organiser. Tested with pytest on GitHub Actions.<br><a href="https://github.com/anuragsinghok/cad-automation-portfolio">github.com/anuragsinghok/cad-automation-portfolio</a> |
| Portfolio site                                | 3D Japanese-layout keyboard built with Three.js; Japanese / English; mobile-friendly; hosted on GitHub Pages.<br><a href="https://anuragsinghok.github.io">anuragsinghok.github.io</a>                                                                                                                                 |
| Company website (client project with friends) | Website for an Indian training-equipment supplier: product category pages and a JavaScript FAQ / product-finder chat widget.                                                                                                                                                                                           |

## Skills

|                    |                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Programming</b> | Python, VBA, JavaScript, HTML / CSS, SQL, Shell (Bash)                                                            |
| <b>AI</b>          | Building with generative AI / LLM tools (e.g. Claude Code), AI-assisted prototyping and automation, prompt design |
| <b>Tools</b>       | AutoCAD, AP100, Excel (VBA, data clean-up), Git / GitHub, GitHub Actions                                          |
| <b>Data</b>        | Cleaning, aggregating and analysing data with Python, SQL and Excel                                               |
| <b>Cloud</b>       | AWS — the platform AI products run on; working towards Solutions Architect – Associate (SAA-C03)                  |

## Languages

|                 |                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------|
| <b>Japanese</b> | Used every day at work — meetings, reports, consultations. Preparing for JLPT N3.          |
| <b>English</b>  | Business level — can read English technical documentation and explain it to Japanese teams |

## Education & research

|                     |                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------|
| <b>2024</b>         | B.Tech, Computer Science & Engineering — Amity University, Noida, India                      |
| <b>Publications</b> | Two conference papers on AI and cybersecurity (ICRITO 2024; ICCSC, published in IEEE Xplore) |

## Visa

Engineer / Specialist in Humanities / International Services — already working in Japan. For a role in the same category, no new visa application is usually required.

## What I bring

- **Ready for a Japanese team:** 1.5 years of 報連相 and Japanese teamwork in practice.
- **I build with AI:** I turn ideas into working tools fast with LLMs — and want to do it for AI SaaS products.
- **Bilingual bridge:** English documentation → clear communication with Japanese colleagues.
- **Long-term:** I want to settle in and grow with one company building AI products.
